from the foreword is it possible at present to identify a core cluster of theoretical ideas concepts and methods with which everyone working in the area of learning and cognition needs to be familiar would it be possible to make explicit the relationships that we feel do or must exist among the various subspecialties ranging from conditioning through perceptual learning and memory to psycholinguistics and to present these in a sufficiently organized way to help specialists and non specialists alike in relating particular lines of research to the broader spectrum of activity these questions were posed to a substantial number of investigators who are currently most active in developing the ideas and doing the research their response constitutes this handbook first published in 1975 volume 1 of this handbook attempts to present an overview of the field and to introduce the principal theoretical and methodological issues that will persistently recur in the expanded treatments of specific research areas that comprise the later volumes deferring to the current zeitgeist rather than to chronology they begin with the present state of cognitive psychology then introduce the comparative approach and conclude this volume with a rapid three chapter review of the evolution of ideas from conditioning to information processing

first published in 1985 at one end of historical time scale speculations about psychological processes go back to classical greek philosophy and beyond for centuries thereafter the treatment of psychological subject matter remained largely in the domain of other disciplines especially philosophy where it became inextricably interwoven with epistemology the chapters of this book glance only briefly at these philosophical antecedents to review the basic concepts and principles that early investigators were to take for granted they tend then to move to the end of the last century when the systematic study of psychological processes began

cancer patients have benefitted greatly from recent advances in the drugs dose regimens and combinations used to treat their primary tumor and for the treatment or prevention of spread of their disease due to the advances in chemotherapy and other aspects of prevention early detection and treatment modalities an increasing percentage of patients are surviving the disease for some types of cancer the majority of patients live decades beyond their diagnosis for this they are forever thankful and appreciative of the drugs that helped lead to this increased survival rate but no drug is devoid of adverse effects this

also applies to chemotherapeutic agents the acute cytotoxic effects of these agents are well known indeed are often required for their therapeutic benefit the chronic adverse effects are varied and in some cases less well known with the increase in survival rates there has emerged a new awareness of these chronic adverse effects

for ten days a number of neuroscientists met at reisenburg to attend a series of lectures and discussions an institute on animal learning the students were drawn from a wide variety of disciplines including anatomy biochemistry pharmacology physiology and zoology it is probably true to say that many of them had at best a sketchy knowledge about the learning behavior of animals about the conditions which are necessary for learning to take place and about the theories that psychologists have constructed about the learning processes was the institute of any benefit to those neuroscientists whose interests lay in studying the functioning of the nervous system by manipulating it or probing it in some direct way some twenty years ago the answer to this question would probably have been no and there is a very good reason why this view might have been held especially by students of the mammalian nervous system at that time most investigators used anaesthetised animals or animals immobilized in some other way such as by surgically isolating the brain from the spinal cord by dividing the brain at various levels or through the use of paralyzing agents these conditions achieved two things on the one hand they allowed substantial advances to be made particularly in the analysis of sensory processing and in the analysis of the neuronal mechanisms of relatively simple reflex action on the other hand the experimental conditions virtually eliminated complex behavior
